Shrine Survival

Projekt Shrine Survival

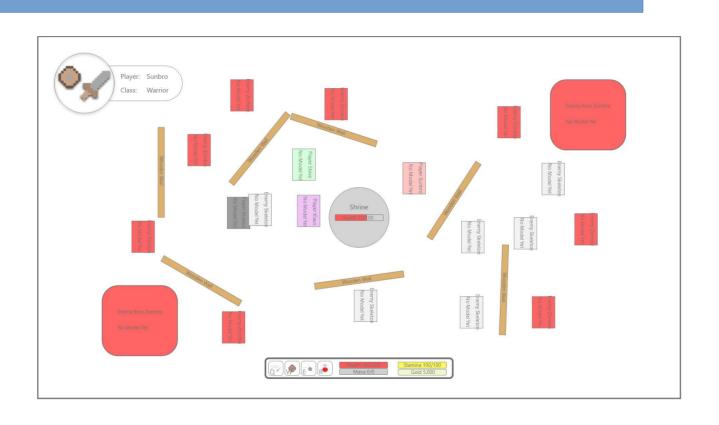

Über mich

- Name: Erik Wiesinger
- Alter: 30
- Herkunft: Gmünd Niederösterreich
- Was bisher geschah:
 - Gelernter Werkzeugbautechniker
 - 8 Jahre bei Husky KTW

Die Idee zu Beginn

- 2D Top Down Spiel
- Wellen an Gegnern überleben
- Klassenauswahl
- Itemnutzung
- Charakter Creator
- Highscore erzielen
- Mit anderen Spielern vergleichen

Erstes Mockup

Aktueller Screenshot

Technologie Stack

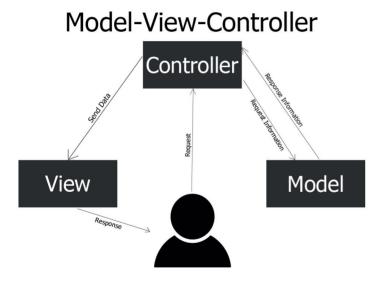

Architekturmuster / Design Patterns

Model View Controller

 Singleton (Datenbank Connector)

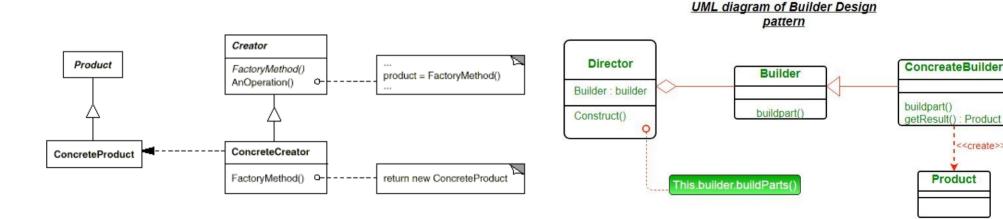

Architekturmuster / Design Patterns

 Factory Pattern (Entity) Objekt)

Builder (Sprite Objekt)

'<<create>>

Code

- JDK 14
 Enhanced Switch
 - Kein break
 - Multiple cases kombiniert

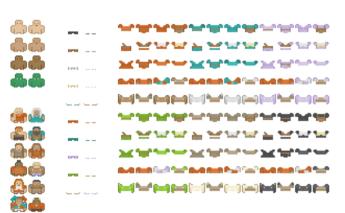

```
mainPane.getScene().setOnKeyPressed(event -> {
    switch (event.getCode()) {
        case UP -> goUp = true;
        case DOWN -> goDown = true;
        case LEFT -> goLeft = true;
        case RIGHT -> goRight = true;
        case W -> attackUp = true;
        case S -> attackDown = true;
        case A -> attackLeft = true;
        case D -> attackRight = true;
    }
});
```

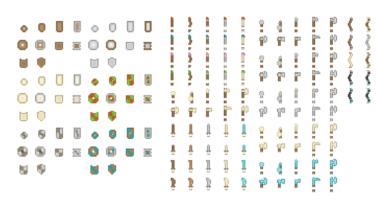

Mehr Code

- Liste mit Lambda
- AtomicReference
 - Updated bei jedem Durchlauf

```
int totalSize = buttonList.size() * 70;
AtomicReference<Double> buttonStartY = new AtomicReference<>(
  (mainPane.getHeight() / 2) - (totalSize / 2)
buttonList.forEach(button -> {
 mainPane.getChildren().add(button);
  button.setLayoutX(buttonStartX);
  button.setLayoutY(buttonStartY.get());
 buttonStartY.updateAndGet(v -> v + 70);
});
```

Spritesheet to Canvas

Objekt "SpriteSheet"
 Liest .png aus Resources

```
    Objekt Sprite
        Erstellt Canvas mit

    Tilesize
```

```
public Spritesheet(String url) {
  this.tilesize = 16;
  this.margin = 1;
  try {
    image = new Image(getClass().getResource(url).toString());
  } catch (IOException e) {
    e.printStackTrace();
  }
}
```

```
public Sprite(Spritesheet spritesheet) {
    this.spritesheet = spritesheet;
    canvas = new Canvas(
        spritesheet.getTilesize(),
        spritesheet.getTilesize());
}
```

Sprite hinzufügen

- Sprite.add(x, y)
 - Errechnen der X,YPosition
 - Hinzufügen des Bildes

```
public void addSprite(int x, int y) {
  double tilesize = spritesheet.getTilesize():
  double margin = spritesheet.getMargin():
  double startX = x * (tilesize + margin);
  double startY = y * (tilesize + margin);
  if (x > 1) {
      startX += margin;
  canvas.getGraphicsContext2D().drawImage(spritesheet.getImage(),
      startX, startY, tilesize, tilesize,
     0, 0, tilesize, tilesize);
```
